1. Project Overview and Objectives

1.1 Overview

Our project is a website for a gym. We called it Nashaat (نشاط), which means activity in Arabic. The site does two things: it gives visitors the information they need about the gym (prices, class times, trainers, location), and it gives members an account where they can book classes and record their workouts.

There is also a small admin area for the gym staff, where they can add classes and trainers, see who booked what, and record payments.

1.2 Why We Chose This Idea

Most small gyms we know run on paper. New members fill in a paper form, the class timetable is a printed sheet that somebody photographs and posts in a WhatsApp group, and bookings are taken by phone or by message. This causes problems we could see ourselves: the timetable in the group is often out of date, people travel to the gym for a class that is already full, and if a member asks how many sessions they have left nobody can answer quickly.

There is also a health side to it. Not enough people in Oman exercise regularly. The WHO STEPS survey found that around 38% of the population does not do enough physical activity (WHO EMRO, 2018), and the Ministry of Health is still monitoring this (Ministry of Health, 2025). Physical inactivity is one of the main risk factors for diabetes and heart disease (WHO, 2020). A website will not make anyone exercise, but things like not knowing the prices, not knowing the timetable, and turning up for a full class do stop people from going. Those are problems a website can fix.

1.3 Objectives

By the end of the project our website should:

1	Show the membership plans, prices and opening hours online so that visitors do not have to call the gym to ask.
2	Let a new member register and choose a plan through an online form instead of a paper form.
3	Let members see the class timetable and book or cancel a place online, with bookings limited to the class capacity and no double bookings.
4	Give members a personal page where they can log their workouts and see their progress.
5	Give the gym staff an admin area to manage members, plans, classes, trainers and payments.
6	Provide a workout library for beginners, with exercises explained by muscle group and difficulty level.

1.4 Scope

We are not doing online payment. Members will register on the website but pay at reception, and the admin records the payment. We are not building a mobile app because a responsive website works on a phone anyway. We are also not giving medical or diet advice; the workout library explains exercises and safety only. Both people we interviewed agreed with these choices. We are also not building an Arabic version for now; it is left for future work, although the member we interviewed said it would help.

2. Target Audience and Stakeholders

2.1 User Groups

Three types of users will use the website.

Table 1: User groups and what they need

User group	What they need
Visitor (not a member)	Wants to see prices, timings, classes, trainers and photos before deciding. Should not have to register to look around.
Member	Wants to log in, book and cancel classes, see the days left on their membership, log workouts, and send a message to the gym.
Gym manager / reception	Wants to add plans, classes and trainers, manage member accounts, record payments, and read the messages sent through the website.

2.2 Stakeholders

The main stakeholders are the gym owner, the members and the trainers. The owner cares about getting new members and spending less time answering the same questions on the phone. Members care about joining easily and knowing whether there is a place in a class. Trainers care about filling their classes and being seen by new members. Our course instructor is also a stakeholder, because the website must show that we used the techniques taught on the course.

2.3 Interviews

We interviewed two stakeholders in week 3. We asked for permission first and told them the information would only be used for this project. We did not record their names here.

Interview 1 - Gym manager

We met the manager of gym in ALansab on 8-oct-2026. The interview took about 15 minutes. We asked him how members join, how class bookings work, and what went wrong.

He told us that new members fill in a paper form, the details are copied into a record book, and payment is taken at the desk. He said the two questions he answers most on the phone are the prices and the class times. For classes, members call or send a message to the WhatsApp group, and the staff keep a list on paper. His main complaint was that sometimes 25 people arrive for a class that only has 18 places, and the people who are turned away are angry because they travelled to the gym specially. He also admitted that

the record book gets damaged and then they cannot quickly prove what a member paid. He wants to know which classes are always full so he can add more of them, and he said member information is private and must not be readable by other members. When we asked about online payment he said no, he prefers members to pay at reception.

Interview 2 - Gym member

We also interviewed a 20-year-old SQU student at the same gym on 6-oct-2026, who has been a member for 4 months. We asked how he finds out the timetable, whether he follows a training plan, and what would make him train more often.

He finds the timetable from a photo of the printed sheet in the WhatsApp group, and he says it is often blurry, so he calls to check. Twice he went to the gym for a class that was already full, and after that he stopped going to the busy classes. The trainer wrote him a plan on paper, and he lost it after a week, so now he does whatever he remembers. He only tracks his weight in his phone notes and does not know how many times he trained last month. The thing that stops him training more is not knowing what to do when he gets there. He uses his phone at the gym, and he said Arabic support would help his family too. Like the manager, he prefers to pay at reception rather than enter card details online.

2.4 What We Took from the Interviews

Table 2: What the interviews told us, and what we will build

What we were told	What we will do about it
Staff answer the same questions about prices and times all day.	Publish plans, prices and the timetable on public pages that work on a phone.
Paper forms are slow and the record book gets damaged.	Make registration an online form that saves straight to the database, with the administrator able to see payment records.
Classes get overbooked and members waste a trip.	Add online booking that checks the class capacity and blocks duplicate bookings.
Members lose the paper-training plan.	Add a workout library and let members log their own workouts in their account.
Members cannot see their progress.	Show a simple progress page with weight and the number of sessions.
Member details are private.	Hash passwords, use prepared statements, and make sure a member can only open their own records.

3. Similar Websites

We looked at two existing websites to see what they do well and what they miss.

3.1 Gold's Gym (goldsgym.com)

This is the website of a large international gym chain. Its main purpose is to advertise the brand and get people to send an enquiry (Gold's Gym, n.d.). The site has a page for each branch with the opening hours,

the facilities and some photos. There are membership enquiry forms, descriptions of the classes and programs, and the whole site follows one template with a strong color scheme.

It is well made. The brand is clear, the layout is the same on every branch page, and it is obvious what to do next. But it is built for advertising and not for members. There is no member login, no way to book a class, and nothing to track your own training. It is also not written for the local market, and the pages are heavy with video and large images, so they load slowly on a weak mobile connection.

Our site keeps a simple, clear layout but adds the parts a member needs: a login, class booking with a capacity limit, and a progress page. We also use Omani Rial and local opening times, and we keep the pages light. An Arabic version is left for future work.

3.2 ClassPass (classpass.com)

ClassPass is not a gym. It is a booking platform that works with many studios and gyms and sells access through a monthly subscription (ClassPass, n.d.). Users search by activity, location and time, see live availability, and book using credits. There are clear rules about cancelling, and reviews from other users.

The booking flow is the best part of the site and the part we learned the most from. You can see exactly what is available at the moment you look, and the whole booking takes a few taps. The downsides for a small local gym is that it is a paid third party, so the gym pays commission and does not own the customer relationship, and there is nothing on it for training or progress. It also pushes you to create an account and add a card before you can do much.

We are copying the good idea, real availability at the moment of booking with a clear message when a class is full, but inside the gym's own website, so the gym keeps its members and its data. Browsing does not need an account and we take no commission. We also add the training and progress parts that ClassPass does not have.

3.3 Comparison

Table 3: Comparison with our proposed website

	Gold's Gym	ClassPass	Nashaat (ours)
Main purpose	Advertising and enquiries	Booking marketplace	Information plus member services
Member login	No	Yes	Yes
Class timetable and booking	No	Yes, with live availability	Yes, with a capacity limit
Progress tracking	No	No	Yes, simple
Workout library	No	No	Yes, for beginners
Cost to a small gym	Franchise fees	Commission on every booking	Free hosting, no commission
Made for Oman	No	No	Yes (OMR and local times; Arabic planned for later)

4. Website Features and Functionalities

These are the six main features we plan to build.

4.1 Membership plans

A public page that lists the plans with their price in Omani Rial and what is included. The plans are read from the membership_plans table, so when the manager changes the price the website changes too and nobody must reprint a sheet. This covers objective 1 and answers the most common phone question from interview 1. Built with PHP and MySQL, displayed in an HTML table and styled with CSS.

4.2 Registration and login

A visitor fills in a registration form with their name, e-mail, phone, date of birth, gender, chosen plan and password, and ticks a consent checkbox. JavaScript checks the form as it is typed, and PHP checks it again on the server because the JavaScript check can be bypassed. The password is saved as a hash, never as plain text. After registering, the member can log in. The same login system is used by the admin, and each role only sees its own pages. This covers objectives 2 and 5.

4.3 Class timetable and booking

A weekly timetable showing the day, time, class name, trainer, level and how many places are left. A logged-in member can book a place with one click and cancel it later. The system refuses the booking if the class is full and refuses it if the member already booked that class. When somebody cancels, the place becomes free again. This is the feature that fixes the biggest complaint from the interviews and covers objective 3. It uses PHP with prepared statements and a transaction that locks the class row, so two people booking the last place at the same time cannot both get it.

4.4 Member page with workout log and progress

After logging in, a member sees the days left on their membership, their next booked class, how many times they trained this month, and a simple line or bar chart of their recorded weight. They can log a workout session (date, type of workout and duration), record their weight, and delete their own entries. We kept this page small on purpose, because the member we interviewed said a complicated dashboard would put him off. This covers objective 4.

4.5 Workout library

A list of exercises. Each one has the name, the muscle group, the difficulty level, how to do it and a safety note. The library starts with about twelve exercises. Members can filter by muscle group. The filtering happens in the browser with JavaScript, so it is instant. This covers objective 6 and answers the member who said he does not know what to do when he gets to the gym. Built with MySQL, PHP and JavaScript.

4.6 Admin area

A protected area that only the admin account can open. The manager can add, edit and delete plans, classes and trainers, manage member accounts, record a payment, view the bookings for each class, and

read the messages and mark them as answered. Every admin page checks the user's role before it runs anything. This covers objective 5 and gives the manager the class list he asked for in interview 1.

4.7 How the features match the objectives

Table 4: Features and the objectives they cover

Feature	Objectives	Technology used
Membership plans page	1	HTML, CSS, PHP, MySQL
Registration and login	2, 5	HTML forms, JavaScript, PHP sessions, MySQL
Class timetable and booking	3	PHP, MySQL, JavaScript
Member page, workout log and progress	4	PHP, MySQL, JavaScript, CSS
Workout library	6	MySQL, PHP, JavaScript
Admin area	5	PHP, MySQL, sessions, role checks

5. Website Logo Design

Figure 1: The Nashaat logo

Figure 2: The badge version used as the site icon

5.1 The Idea

The logo is a rounded square badge in teal with one white dumbbell in the middle. Below the badge is the word NASHAAT with the tagline “Move • Track • Improve”.

We chose the name Nashaat because it is an Arabic word meaning activity, everyone here understands it, and it is short enough to work as a logo. An English brand name would not have the same effect on a local audience.

We went through a few versions before this one. One of them had an extra arrow symbol above the dumbbell to mean progress, but we removed it, because the dumbbell already says “gym” on its own and the second symbol only made the badge look crowded and unclear when it was small. One clear symbol is easier to recognize than two.

The logo is flat: no gradients, no photographs and no shadow. That way it still looks correct when it is very small, for example as the icon in the browser tab, and it can be printed in a single color if we ever need to put it on a shirt or a sign.

5.2 Colors

Table 5: Logo colors and why we chose them

Colour	Code	Where we use it	Why
Teal	**#0E6B57**	Badge background, headings, navigation bar	Green stands for health and it looks calm and trustworthy, which matters because the site holds personal information. Most gyms use red and black, so teal also makes us look different.
White	**#FFFFFF**	The dumbbell, page background, text on teal	It is the strongest contrast against teal, so the dumbbell still reads clearly when the badge is tiny.
Dark teal	**#0B5242**	The word NASHAAT, footer	A darker shade of the same color, for text that must be easy to read.
Orange	**#F2A33C**	The tagline, buttons, links	Orange is energetic, which is the opposite feeling to the calm teal. We only use it on things the user should notice or press.
Grey	**#5F6B68**	Body text and captions	Softer than black for long paragraphs, but still readable on white.

5.3 Shapes and Font

- We used a rounded square instead of a circle. A square looks more solid and modern, and it uses the space better, so the dumbbell can be bigger inside it. The corners are rounded so it still looks friendly rather than sharp.
- The dumbbell is the only symbol in the logo. It has two plates on each side of the bar, so it is balanced, and balance is what we want the training advice on the site to be as well. It is drawn with simple rounded rectangles, which keeps it clean at any size.
- The whole mark is symmetrical, mirrored left and right. That reads as balance and professionalism, and it always looks correct when it is centered in a header or on a printed sign.
- We rounded the ends of the bar and the plates. Sharp corners look aggressive, and the member we interviewed said he feels shy in the gym, so we wanted the brand to look friendly.
- The name is in a bold sans-serif in capital letters, with the tagline much smaller underneath. Sans-serif is the right choice for a website because it stays readable on a small screen, and we use the same family on the pages so everything matches.
- The badge also works on its own without the word, so we can use it as the browser tab icon where there is no room for text.

6. Website Content and Page Descriptions

The website has eight pages. That is the three required pages (Home, About Us, Contact Us) plus five more, which is what the project asks for.

Table 6: The pages and what is on each one

Page	What is on it
index.html (Home)	The logo, the tagline and the Join Now button. A short introduction to the gym. A summary of the plans with prices. The next three classes. Three trainer photos. Opening hours and a map. This is the page a visitor sees first, so it must answer the price question immediately.
about.html (About Us)	The gym's story and mission, photos of the facilities, the gym rules, and a short section about the team that built the website. Required page.
contact.html (Contact Us)	Address, phone number, opening hours, a map, and a contact form with name, e-mail, subject and message. The form is validated and the message is saved in the database so the manager can see which ones are still unanswered. Required page.
plans.html	A comparison table of all the membership plans with the price, the duration and what is included, plus a few common questions about membership. The Join button here passes the chosen plan to the registration form.
classes.html	The weekly timetable as a table. Each row shows the day, time, class, trainer, level and places left. Members can book from here. If a class is full the button is disabled and a message appears. This is the most important page for the objectives.
trainers.html	A card for each trainer with a photo, their specialization, their experience and the classes they teach.
workout.html	The workout library. Exercises are shown as cards and can be filtered by muscle group. Each card has instructions and a safety note.
dashboard.html (member area)	The member's own page after logging in: days left on the membership, next booked class, sessions this month, the progress chart, and buttons to log a workout or record their weight. It is only reachable after login.

Navigation is the same on every page: a bar at the top with the logo on the left and the links on the right, plus a Login or Register button. On the phone the bar shrinks to a menu button. The footer repeats the opening hours, the address, the phone number and the privacy statement. There is also a Register page and a Login page, which are part of the account system rather than separate content pages.

All the writing on the pages is our own. Wherever we mention a health fact we put the source on the page. Every image has alternative text, every form field has a label, and we checked the colors for contrast.

7. Database Design and Data Management

7.1 What Data We Store

The website stores three kinds of data. First, account data: name, e-mail, phone, date of birth, gender and a hashed password. Second, membership and booking data: which plan a member is on, when it starts and ends, which classes they book and whether the membership is paid. Third, fitness data: workouts, body measurements and body weight. The third kind is the most sensitive, so we treat it carefully.

We do not store any card numbers. Payment is recorded on the member's membership record as paid or unpaid, with the date and the method (cash or bank transfer).

7.2 Tables

The database has eleven tables. The last column shows the foreign keys that link the tables together.

Table 7: The database tables

Table	What it stores	Links to
`users`	Everyone who can log in: members and the admin. Name, e-mail, hashed password, phone, gender, date of birth and role.	Used by members
`membership_plans`	The plans, their duration, price in OMR and what is included.	Used by members
`members`	A member's plan, start date, end date, status (active or expired) and payment (paid or unpaid, date and method).	user_id, plan_id
`trainers`	Trainer profiles: specialization, experience, certifications.	Used by classes
`classes`	The classes offered: name, trainer, level, capacity, the room and whether it is men only, women only or mixed.	trainer_id
`class_schedule`	The actual dates and times a class runs, so the timetable can change each week.	class_id
`bookings`	Which member booked which class date. A cancelled booking is deleted, so the place becomes free again.	member_id, schedule_id
`workouts`	A training session logged by a member: date, type of workout and duration.	member_id
`progress_log`	The weight of the member and measurements on a given date, used for the progress chart.	member_id
`exercises`	The workout library: name, muscle group, level, how to do it and a safety note.	Used by the workout page
`contact_messages`	Messages sent through the contact form: name, e-mail, subject, message, date and whether it has been answered.	None

The users table is the center of the design. Most of the other tables belong to a user or point at one, and the role column decides what that user is allowed to open. Here is the users table in detail as an example:

Table 8: The users table

Field	Type	Notes
user_id	INT	Primary key, auto increment
full_name	VARCHAR(80)	Not null
email	VARCHAR(120)	Not null, unique, used to log in
password_hash	VARCHAR(255)	Not null, stored as a hash only
phone	VARCHAR(20)	Not null
gender	ENUM('male', 'female')	Needed because some classes are men only or women only
dob	DATE	Used for the student plan
role	ENUM('member', 'admin')	Decides which pages the account can open
created_at	DATETIME	Registration date

The bookings table has a UNIQUE key on (member_id, schedule_id). That means the database itself stops a member booking the same class twice, even if something goes wrong with the PHP code.

7.3 How Data Moves Between Users

The website uses the client-server model from the course. The browser is the client, PHP on the server does the work, and MySQL stores the data. The browser never talks to the database directly.

A visitor can read the public pages and can write only two things: a registration and a contact message. A member can read and write their own records and nothing else. The admin can do everything, including deleting records.

For example, when a member books a class: the browser sends the class date to booking.php with the session cookie. PHP checks that the user is logged in and is a member, then checks that the class exists and is in the future. It counts the current bookings and compares that with the capacity. If the class is full, it sends back a message and suggests the next date for that class. If there is space it checks that the member has not already booked it and then inserts the row inside a transaction that locks the class row, so two people cannot take the last place. Finally, it sends back the new number of places left, and JavaScript updates the counter on the page without reloading it.

7.4 Security

Because we store personal details and body measurements, we are doing the following:

- Passwords are saved with PHP's password_hash() using bcrypt. We never store or e-mail a plain password.

- Every query that uses input from a form uses a prepared statement with bound parameters, so form input cannot run as SQL. Output escaped with htmlspecialchars() so a message cannot inject script into a page.
- JavaScript validates forms for the user's benefit, but PHP always validates again, because the browser check can be switched off.
- The session is regenerated when a user logs in, the cookie is marked HttpOnly, and every protected page starts by checking the role.
- The site runs over HTTPS, so passwords and measurements are encrypted while they travel.
- We only ask for data we use. For example, registration does not require an address or an ID number.
- A member can only open their own records. Trainers do not have accounts, so they cannot see any member data.
- The SQL file in the private GitHub repository holds only the table structure and test data, never real member data, and we follow the data protection principles of Oman's Personal Data Protection Law (Royal Decree 6/2022).

8. Web Hosting Selection and Justification

8.1 Hosting Requirements

Our website needs a host that can run the technologies planned for the project: XHTML, CSS and JavaScript for the pages, PHP for the server-side logic (login, booking and admin functions), and MySQL for storing users, classes and bookings. XHTML, CSS and JavaScript run in the visitor's browser, so any host can serve them. PHP and MySQL are the real filters, because many modern hosts only serve static files or Node.js apps. We also need a host that costs nothing, since this is a course project, and that gives us a way to upgrade if the gym adopts the site.

8.2 The Options We Compared

Table 9: Hosting options

Host	Cost	PHP and MySQL?	Notes
InfinityFree (our choice)	Free	Yes. PHP 8.4 and MySQL 8.0 / MariaDB 11.4	5 GB space, unlimited bandwidth, free subdomain, free SSL, and no adverts placed on the site. Built for people practicing PHP (InfinityFree, 2026).
Vercel	Free tier	No. No native PHP support and no built-in MySQL database	Excellent for static sites and Node.js apps, but PHP only works through a community runtime that Vercel does not officially support, and MySQL needs an outside provider (Vercel, n.d.).

Host	Cost	PHP and MySQL?	Notes
000webhost and similar old free hosts	Free tier	Used to be yes, but the free plans have been cut back	The free tier has changed a lot and in some regions is gone, and storage and database limits are tight. We would have to check the terms again before using it.
Hostinger shared hosting	Paid, monthly	Yes, PHP and MySQL on all plans	Much faster and more reliable, with support and backups, and it is what we would use if the gym really adopted the site. We cannot pay for it for a course project (Hostinger, n.d.).

8.3 Our Choice

We chose **InfinityFree**, for the following reasons:

- **Technology support:** It runs PHP 8.4 and MySQL 8.0 / MariaDB 11.4 and serves XHTML, CSS and JavaScript normally, so it meets every technical requirement of the project without connecting any external service.
- **Cost:** It is completely free, with no adverts injected into the pages, a free subdomain and a free SSL certificate for HTTPS. This matters because the login and booking pages handle personal data.
- **Scalability:** The 5 GB of space and unlimited bandwidth are more than enough for a gym website at this stage. If the number of members grows, our code is standard PHP and MySQL, so we can move to a paid host such as Hostinger by copying the files and importing the same SQL file, without rewriting anything.
- **Reliability:** Free hosting has no uptime guarantee and can be slower than paid plans. We reduce this risk by keeping all code and the database SQL file in GitHub, so the site can be restored or moved quickly if the host has problems.

8.4 Deployment

We will keep the code in a GitHub repository called nashaat-fitness and add the instructor as a collaborator. Each member commits their own work, so it is clear who did what. We develop locally first, then upload to InfinityFree by FTP and import the database through phpMyAdmin using a SQL file that is kept in the repository, so all three of us work with the same tables. The database password goes in a separate config file which we add to .gitignore so it is never uploaded to GitHub.

For Part I we are using Google Sites for the prototype described in the next section. Google Sites cannot run PHP or use MySQL, so it can only show the design. The real booking, login and admin functions will be built on InfinityFree in phases 2 to 4.

9. Website Prototype (Google Sites + Barcode)

9.1 Pages We Built

For Part I we built the prototype in Google Sites so we could agree on the layout and the content before writing any code. It has six pages: Home, About Us, Membership Plans, Class Schedule, Our Trainers and Contact Us. The Home page has the logo, the tagline and a Join now button. Membership Plans have the price table. Class Schedule shows the weekly timetable as a table. Our Trainers has the trainer cards with their specializations. Contact Us has the address, the map, the opening hours and a contact form.

We used the same colors as the logo (teal headings, white background, orange buttons) so the prototype already looks like the final website. The navigation bar is the same on every page and shrinks to a menu button on a phone. We reused the same text in the prototype as in Section 6, so when we build the real pages in phase 2, we only must copy it across.

The prototype cannot show the booking system, the login, the member page or the admin area, because Google Sites does not run PHP and has no database. Those features are represented by the layout only and will be built in the later phases.

9.2 Link and Barcode

Published website: https://sites.google.com/student.squ.edu.om/nashaat-gymandfitness/home

The barcode below opens the same website on a phone. We used a QR code instead of a normal barcode because a web address is far too long to fit in a line barcode, and a QR code is designed for exactly this and scans reliably from a printed page or a screen.

Figure 3: QR code for the prototype website

10. Ethical, Social and Professional Considerations

10.1 Societal Impacts

Impact 1: It can help people exercise more, but it can also leave people out

The good side is that the website removes the small obstacles that stop people from training. If prices and times are always online, if a place in a class can be booked before leaving home, and if a beginner can look up what to do before going, then more people will keep going. Since not doing enough exercise is one of the

leading risk factors for diabetes and heart disease (WHO, 2020), and about 38% of people in Oman were not active enough in the 2017 STEPS survey (WHO EMRO, 2018), even a small improvement matters.

The risk is that a website-first service leaves people out. Some people do not have a smartphone or enough data, some are not comfortable in English, and some older people simply do not like doing things online. Those are often the people who would benefit most from supervised exercise. So, we will keep the reception and the phone working, keep the printed timetable on the noticeboard, and put a line on the website saying that you can still register and book in person. We are also keeping the pages light, and an Arabic version, which the member we interviewed asked for, is left for future work.

Impact 2: Tracking progress motivates, but it can also create pressure

Showing a member their own progress can help keep them training, and the class timetable makes the gym feel more like a community. But numbers about the body can also cause problems. If we put weight at the top of the dashboard, some members will check it every day and feel bad when it does not move, and comparing yourself with other people in a gym is already a real problem.

So, we put the number of sessions first, and weight and measurements second and optional. A member can leave them blank. There are no public leaderboards and no comparison with other members anywhere on the site. We also put a short note on the progress page saying that progress is not a straight line and that anyone with a health condition should speak to a doctor first. Members can delete their own measurement history whenever they want.

10.2 Ethical and Professional Issues

Issue 1: Private and health data

We are storing phone numbers, dates of birth and body measurements. If that leaked it would be serious, and members have no way of knowing how we handle it unless we tell them. The ACM Code of Ethics says computing professionals must respect privacy and be honest with users (ACM, 2018), and Oman's Personal Data Protection Law (Royal Decree 6/2022) also applies. If the gym adopts the site for real, it will also need to check the law's rules on sensitive data such as health information.

> **How we address it:** we only collect what a feature needs, which is why registration does not ask for an address or an ID number. Passwords are hashed, all queries use prepared statements, and the site runs over HTTPS. A member can only open their own records, and trainers have no accounts, so they cannot see any member data. Registration has a consent checkbox, and the footer has a short privacy statement that says in plain language what we store, why, and how to ask us to delete it.

Issue 2: Being honest about health advice

Fitness websites often exaggerate, for example promising weight loss in two weeks, and they sometimes overstate the expertise of their staff. A workout library could also be mistaken for medical advice by someone with a heart condition or an injury. Being dishonest about what we know would break the trust of the people using the site.

> **How we address it:** we say clearly on the website that this is a student project. Any health fact we publish is taken from a real source, like the WHO, and we name the source on the page. Trainer profiles only list certifications the gym confirms are real. The workout library explains how to do an exercise and

what to watch out for and never diagnoses or treats anything. Every page has a short disclaimer that the information is general and not a substitute for a doctor. Only the admin account can publish content, and the admin reviews it before it goes up.

Issue 3: Accessibility and including everyone

A gym serves a whole community, but a badly made website can quietly exclude people. If images have no alternative text, if the contrast is poor, or if the text is too small, some users cannot use the site at all. Somebody on an old phone with a slow connection may give up if the pages are heavy. And in a gym context in Oman, it matters that a member knows before booking whether a class is men only or women only.

How we address it: we follow the WCAG guidelines (W3C, 2024) as far as we can, which means enough contrast, labelled form fields, alternative text on images, keyboard navigation and clear headings. The pages are responsive and light, so they work on an old phone. An Arabic version is left for future work. The timetable labels each class as men only, women only or mixed, so nobody books something they are not comfortable attending, and the booking page does not show other members' names.

10.3 Summary

Table 10: The issues and what we will do about each one

Issue	What we do
Impact 1: excludes people who are not online	Keep reception and phone working and say so on the site, keep the printed timetable, keep the pages light, Arabic as future work.
Impact 2: pressure about body numbers	Put attendance and consistency first, make weight and measurements optional, no leaderboards, add a wellbeing note, let members delete their own data.
Issue 1: privacy of personal and health data	Collect only what we need, hash passwords, prepared statements, HTTPS, members can only see their own data, consent checkbox and privacy statement.
Issue 2: honest health information	Say it is a student project, cite real sources, verify trainer certifications, no medical advice, disclaimers on every page.
Issue 3: accessibility and inclusion	Follow WCAG as far as possible, responsive and light pages, label classes as men only or women only, do not show other members' names.

11. Conclusion

Nashaat is a website for a gym that lets visitors see everything they need to decide and lets members book classes and follow their training in one place. We chose it because small gyms here really do run on paper, and because both people we interviewed described the same problems. The proposal sets out six objectives, the user groups and what they need, two interviews and what we learned from them, two similar websites and how we differ from them, six features, eight pages, an eleven-table database with the security

measures we will use, and a free host that supports PHP and MySQL. In the next phases we will build the HTML and CSS pages, then add JavaScript, then connect it to PHP and MySQL, and finally present it.
